 - Droughts

Methodology

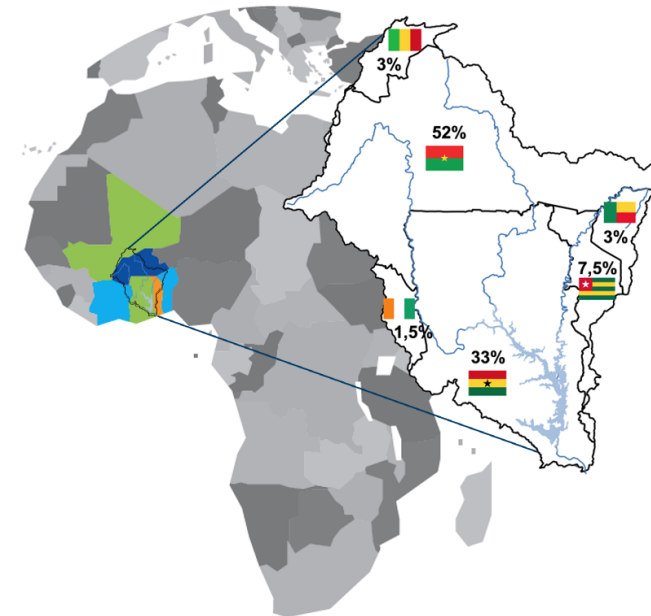

Present conditions and Projections

Climate

Time Frame	Climate Projections (RCP 7.0 – Medium emission scenario)
Mid-term Future (2050)	<p>🌡️+ Increase in temperature by 1.7°C</p> <p>☁️🌧️ Change in precipitation +8%</p>
Far Future (2080)	<p>🌡️+ Increase in temperature by 3°C</p> <p>☁️🌧️ Change in precipitation +9%</p>

Socio Economic

POPULATION

2016

24

[Million People]

34

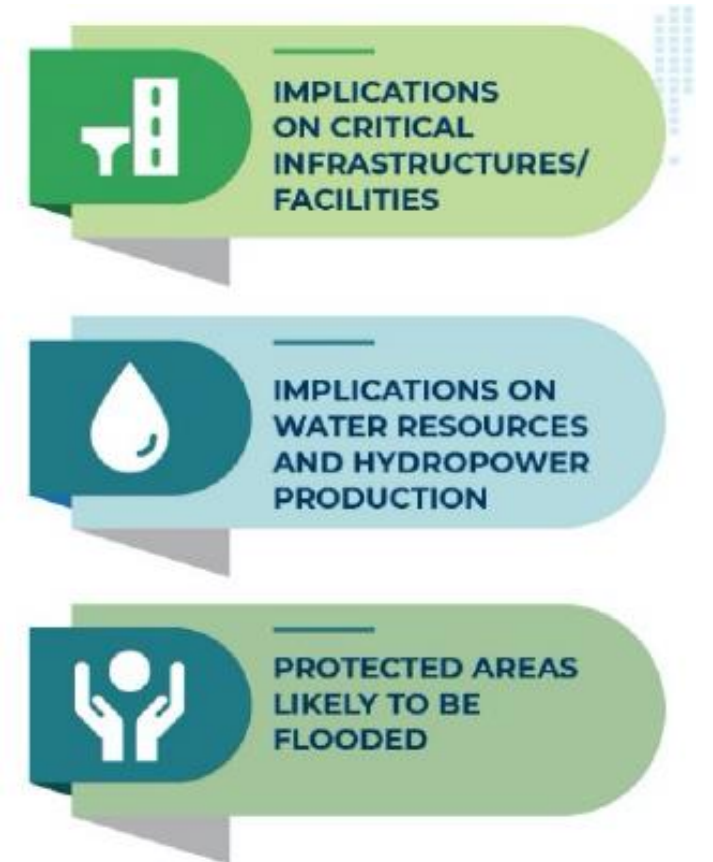

2025 Projection

59

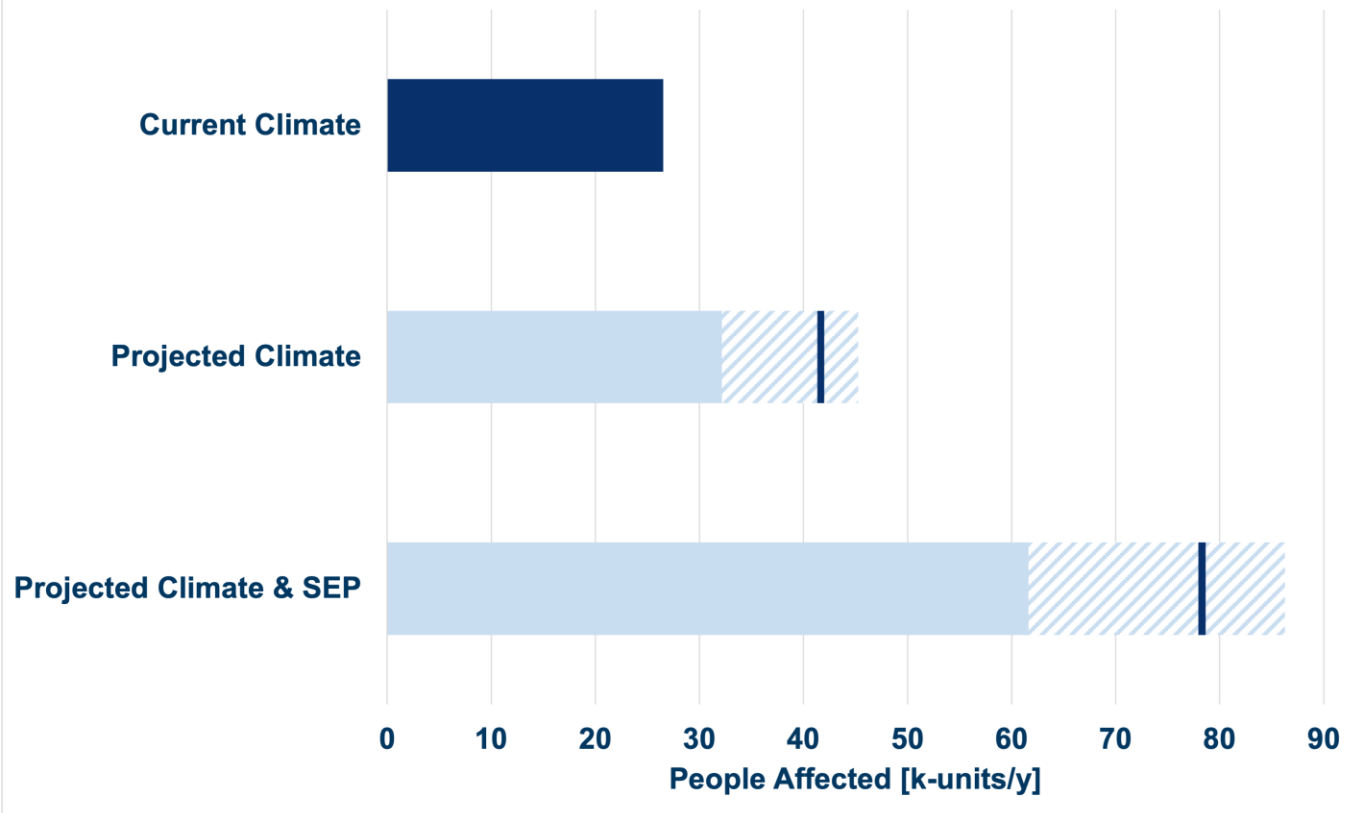

2050 UN Projection

Impacts: population and sectoral losses

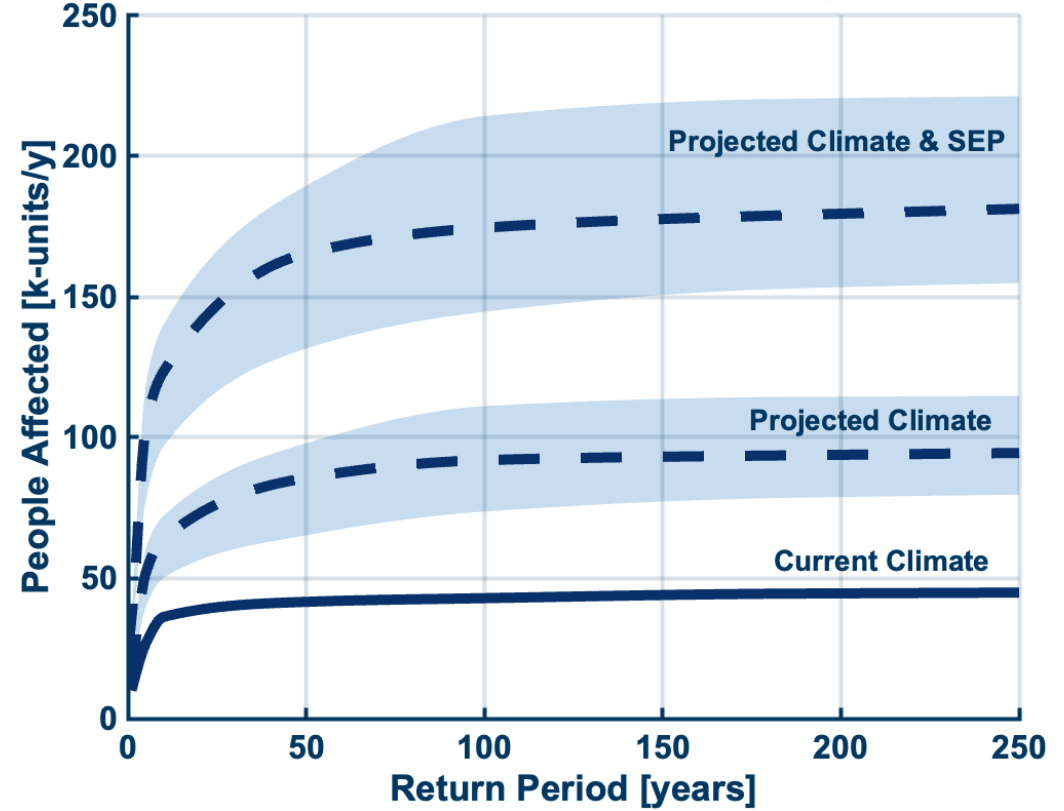

FLOODS

Annual Average Number of People Affected

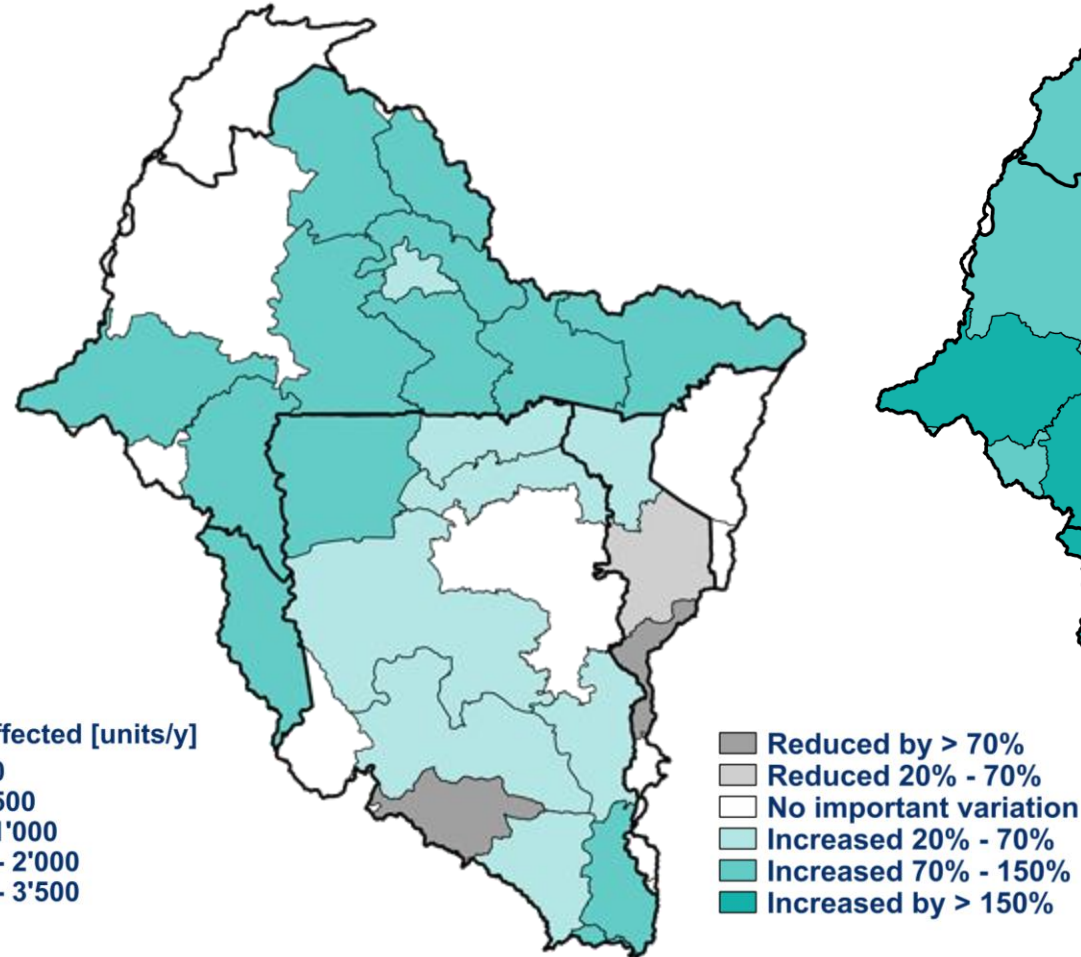

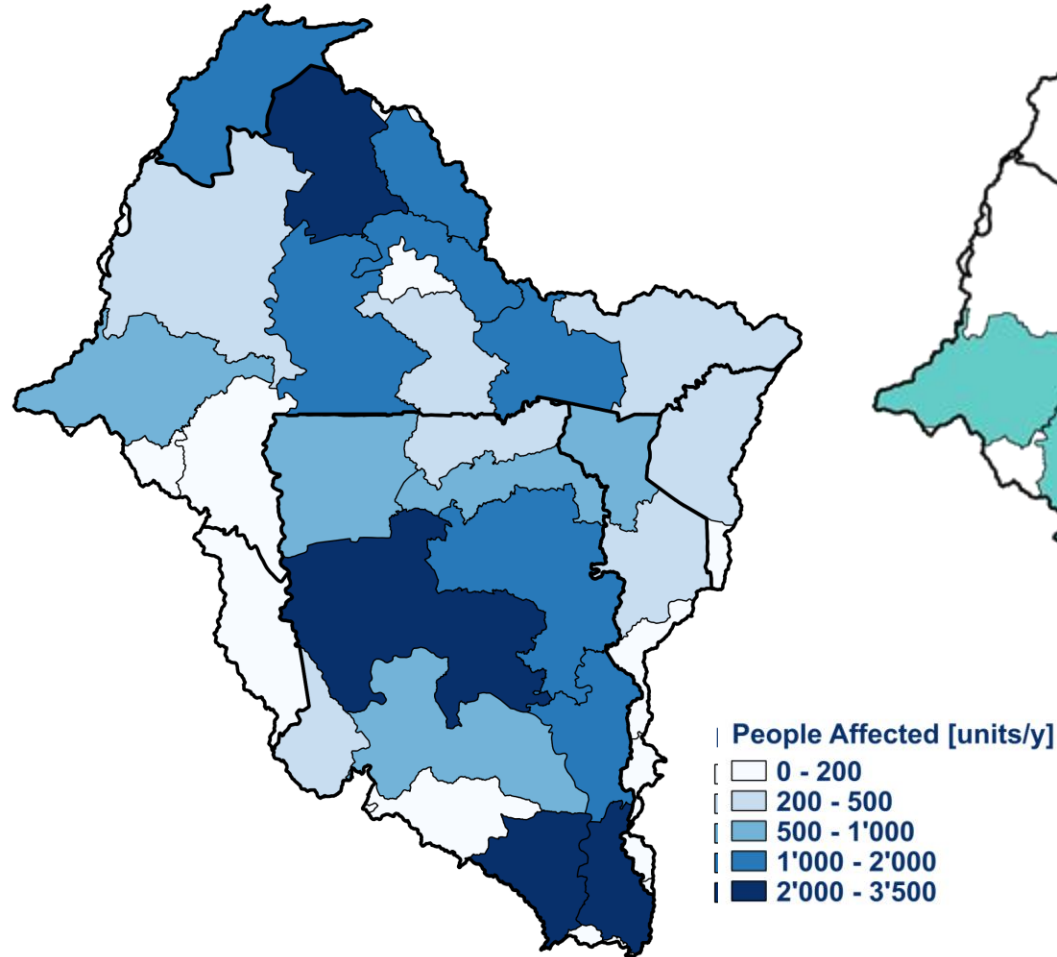

Probable Maximum Loss Curve - Population

Absolute Number in Current Climate Conditions

Absolute Number in Projected Climate Conditions (Reference Model)

Anomaly in Projected Climate Conditions (Reference Model) with UN Population Projection

Task 1: Reading Results for Population Affected pag. 14

Select a region and analyze

- Average number of affected people, compare with figures at basin or national level (pag. 31)
- affected people under future climate condition and socio-economic projections
- PML curves

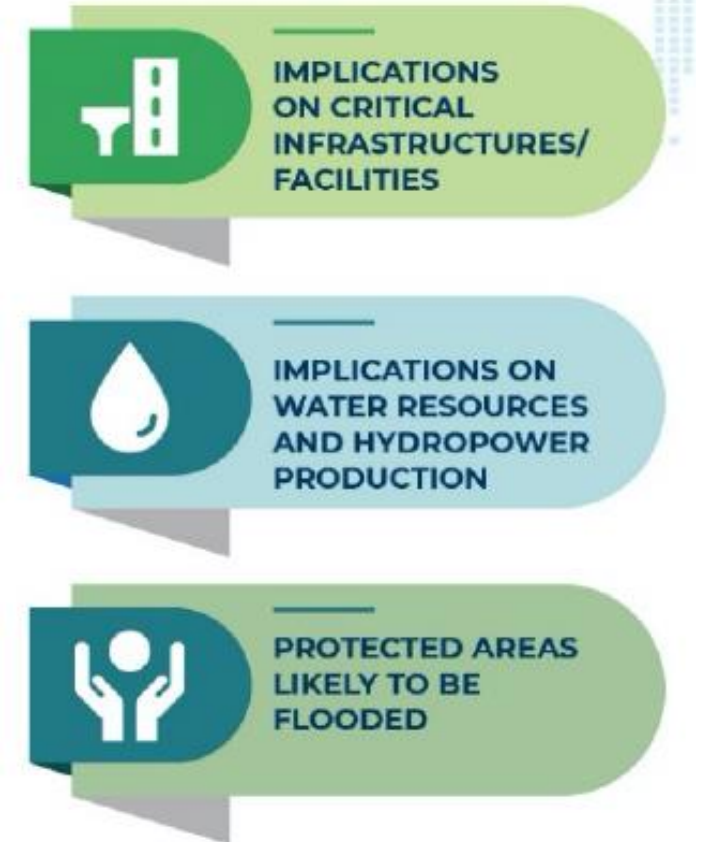

Tasks:

- write over a flipchart 3 key messages for the selected region
- review the existing key messages for the River Basin

Time: 20 min

Impacts: population and sectoral losses

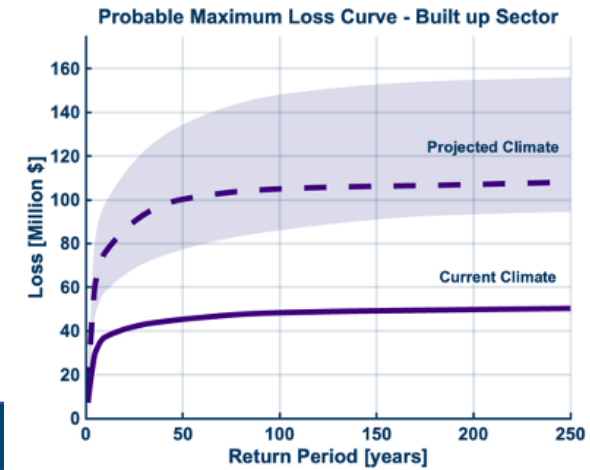

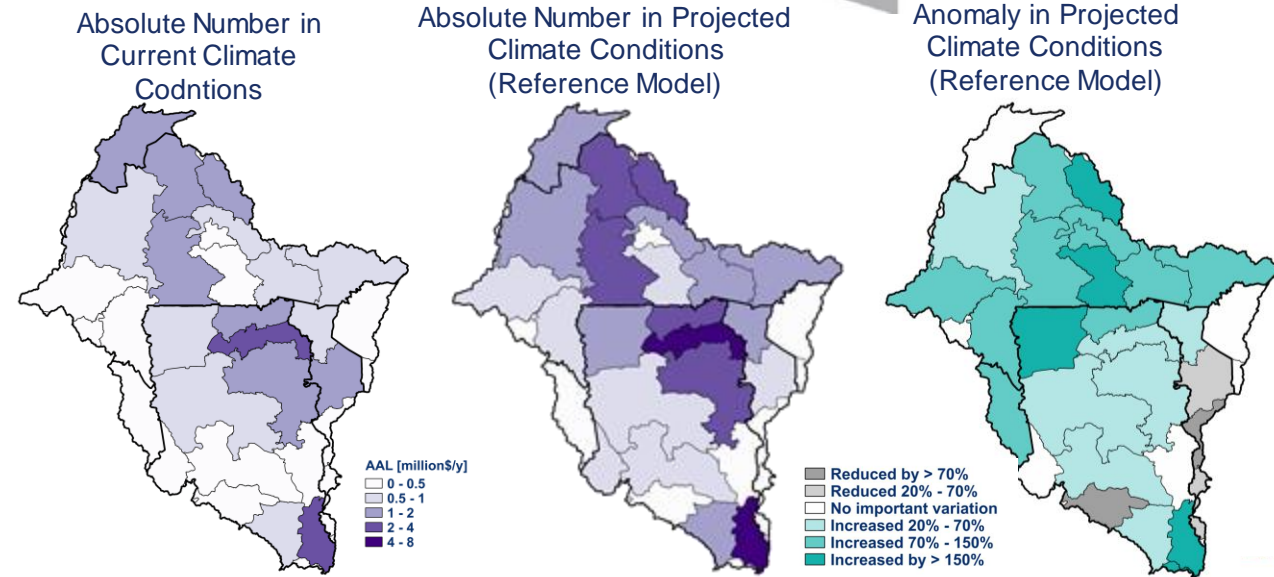

FLOODS

Economic loss – Built-up sector pag. 15-16

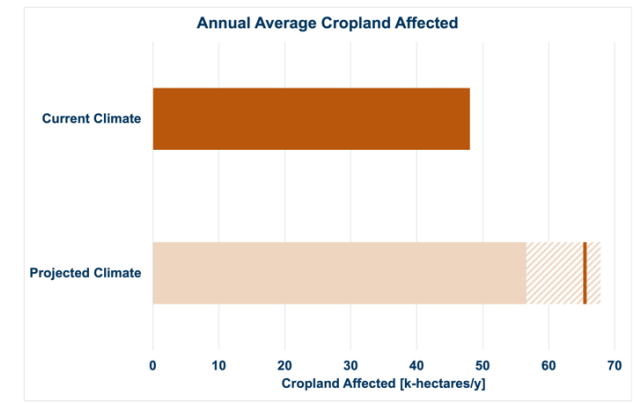

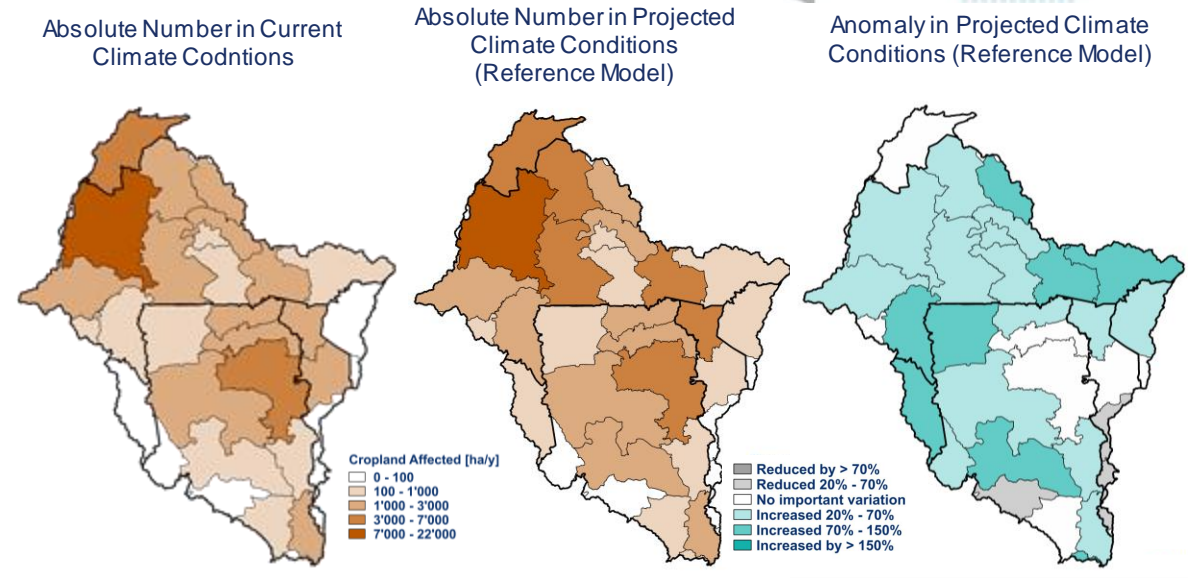

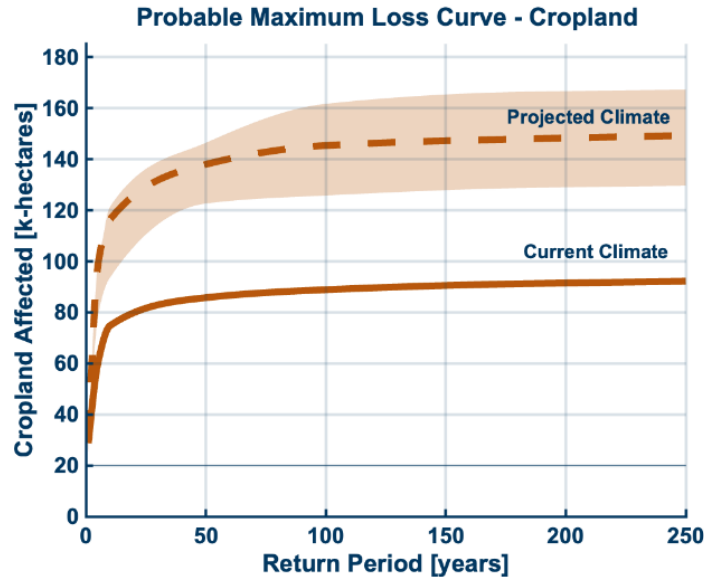

- AAL and PML in USD millions
- AAL with sub-sector details

Crop production loss pag. 17

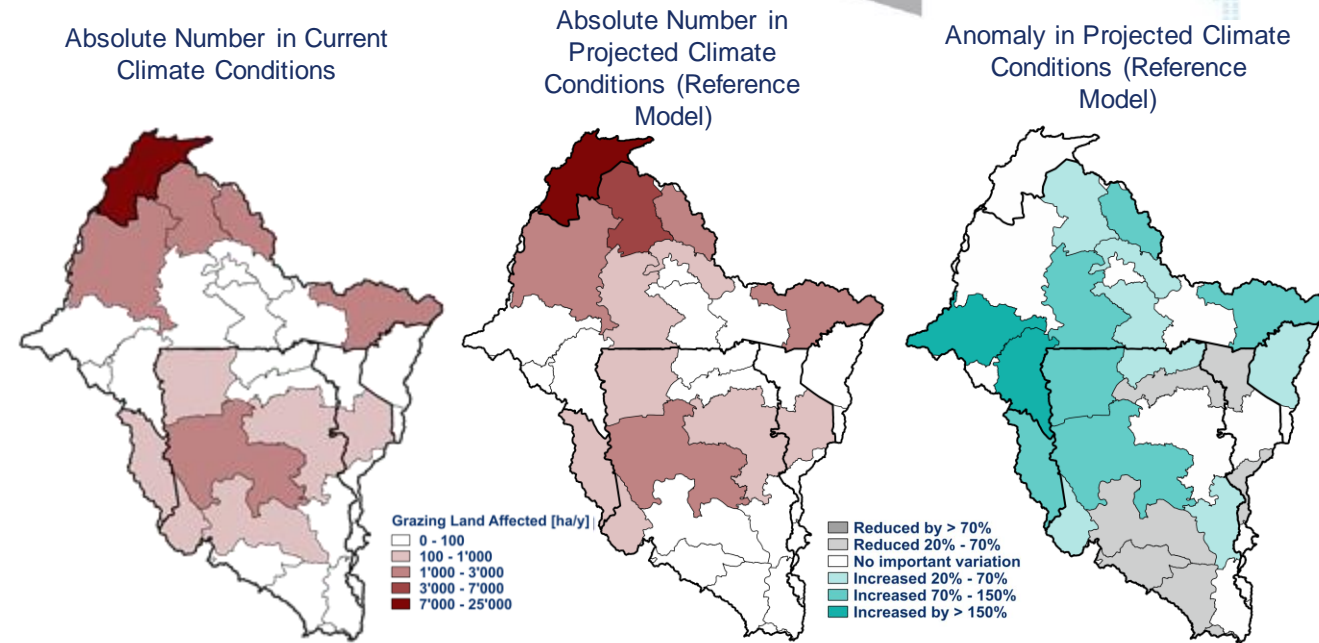

- AAL in hectares of cropland
- PML in thousands of hectares of cropland

Loss of grazing land pag. 17

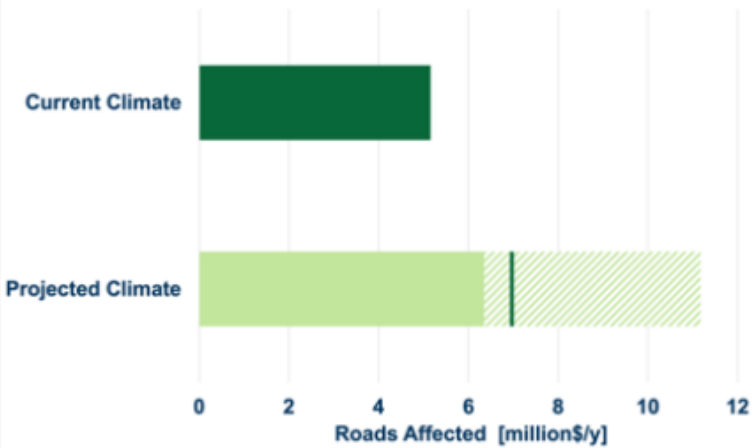

- AAL in hectares of grazing land
- PML in thousands of hectares of grazing land

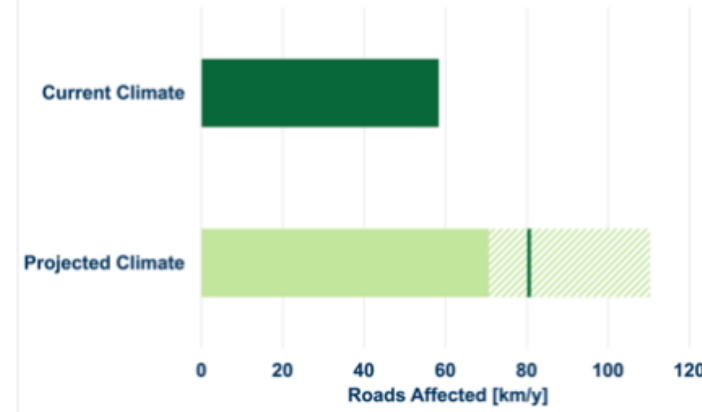

Implications on roads - pag. 18

- AAL and PML in km of roads (right) and \$ (left)

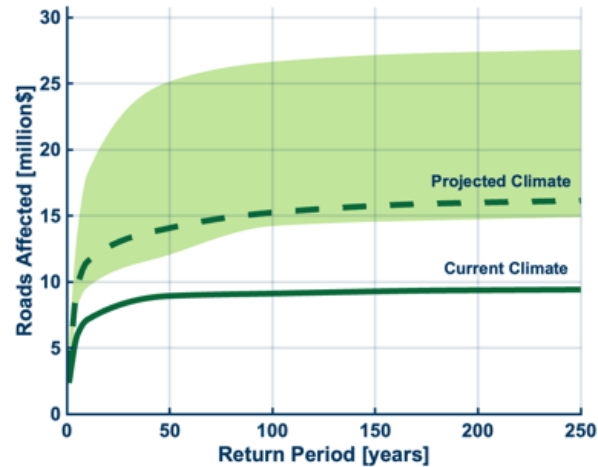

Annual Average Loss to the Road Network

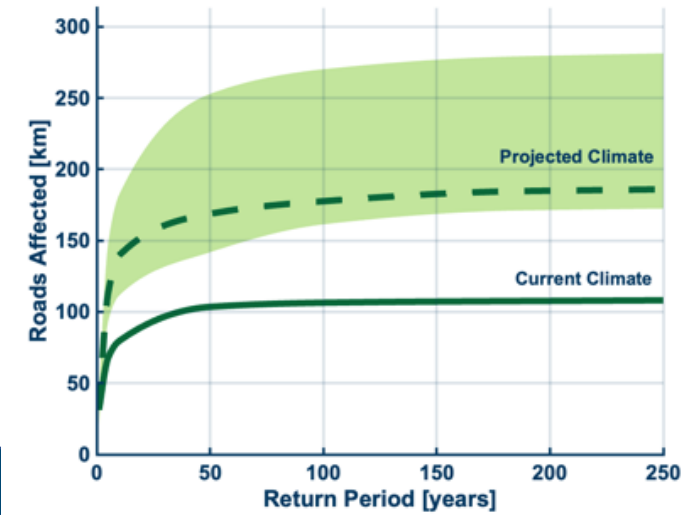

Annual Average Number of km affected

Probable Maximum Loss Curve - Road Network

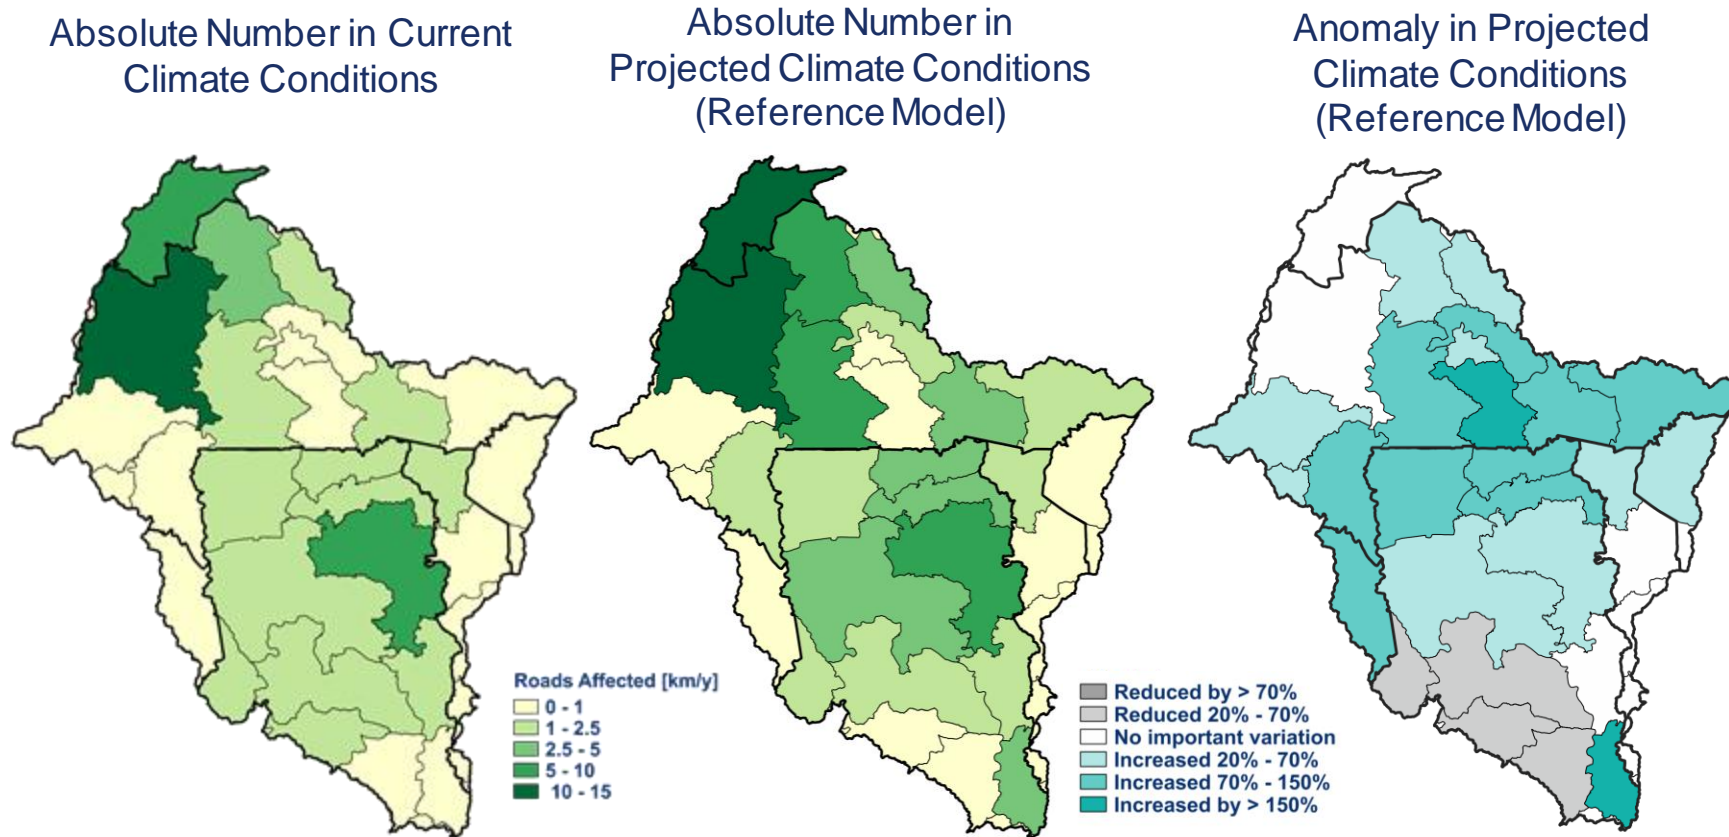

Probable Maximum Loss Curve - Road Network

Implications on roads - pag. 18

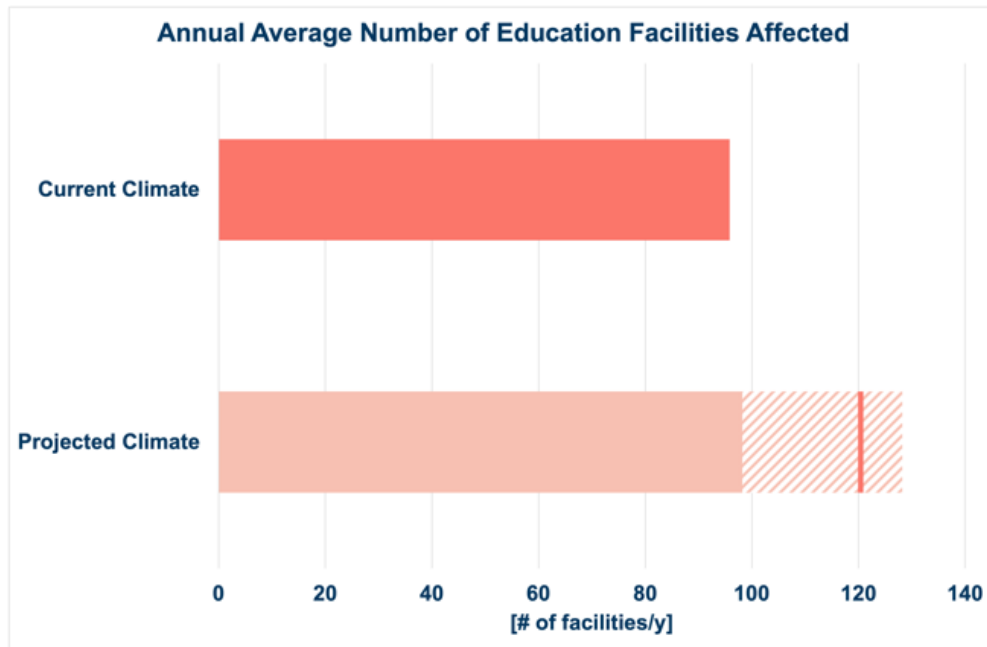

- Spatial distribution of AAL in km of roads

Implications on education and health facilities - pag. 19

- No significative info for spatial distribution of AAL and PML
- AAL in number of facilities
- Need for updated and more precise information about facilities' location

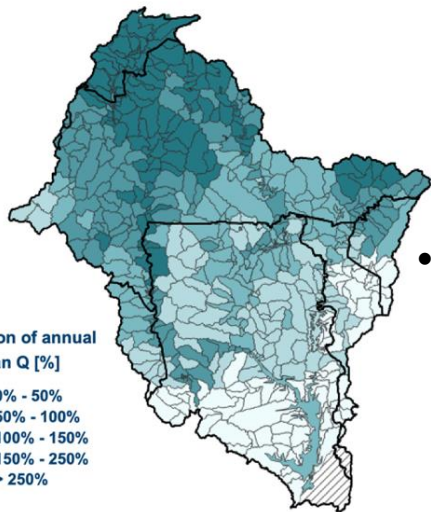

Implications on water resources and hydropower - pag. 20

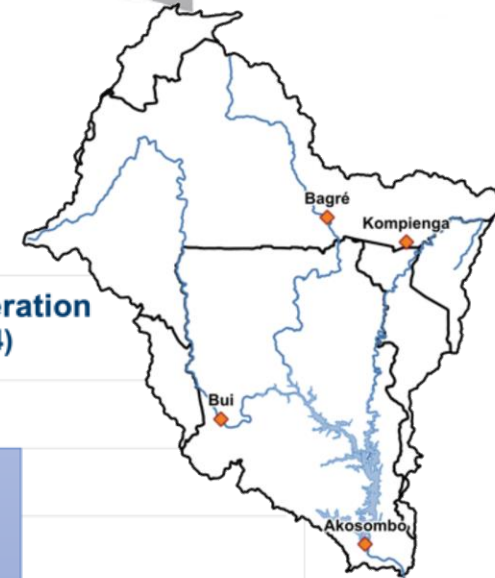

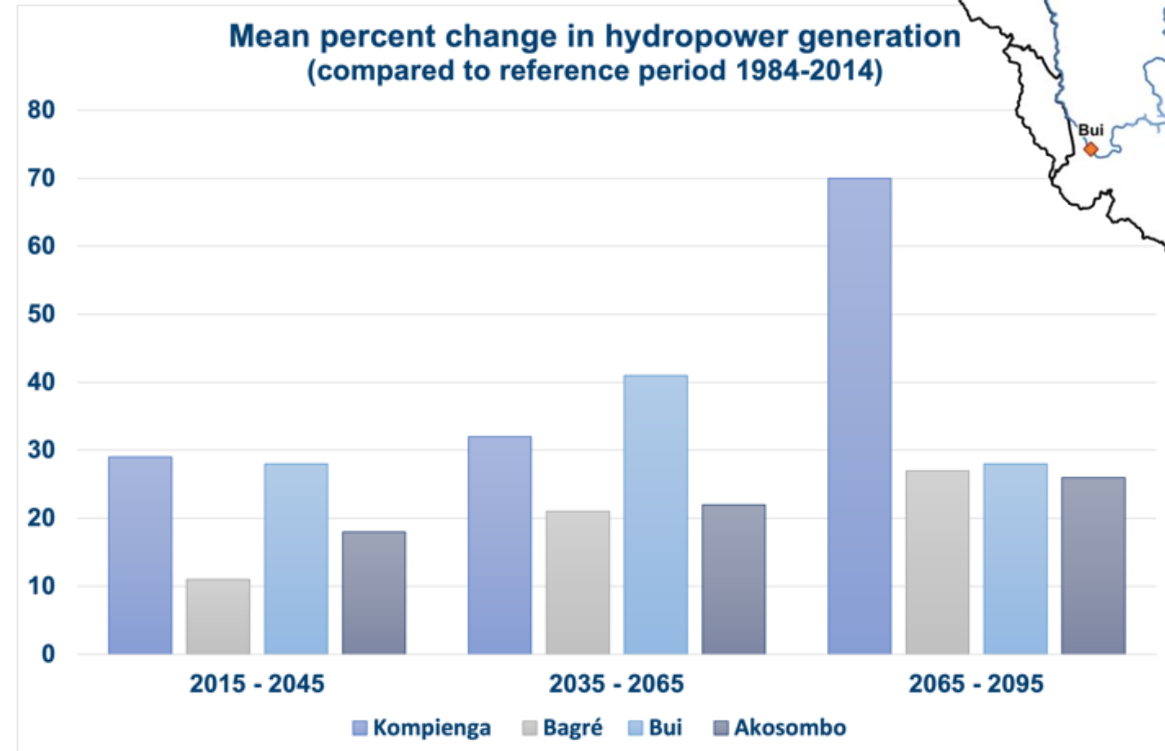

IMPLICATIONS ON WATER RESOURCES AND HYDROPOWER PRODUCTION

- Analysis made on the results of hydrological modelling
- NO AAL or PML
- hydropower potential in terms of % change in future periods compared to ref. historical period

Variation of annual average discharge from current to projected climate conditions

- Water availability expressed in terms of % variation of the annual mean discharge at sub-basin level

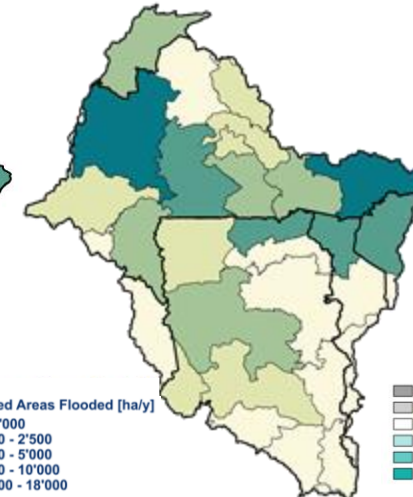

Protected Areas likely to be flooded - pag. 21

- Spatial distribution of AAL in hectares
- AAL in thousands of hectares
- PML in millions of hectares

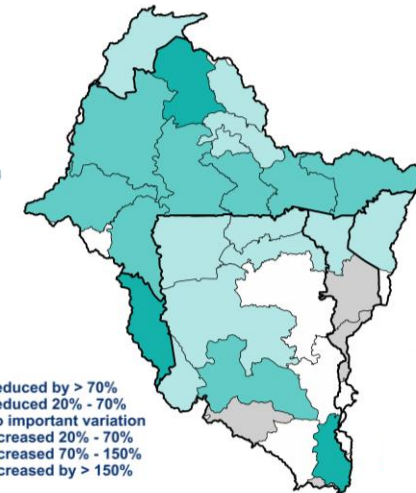

Absolute Number in Current Climate Codntions

Absolute Number in Projected Climate Conditions (Reference Model)

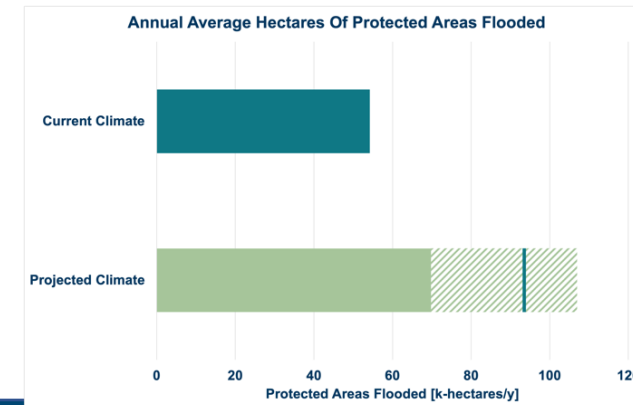

Anomaly in Projected Climate Conditions (Reference Model)

Probable Maximum Loss Curve - Protected Areas

FLOODED vs AFFECTED
Do floods have always affect protected areas?

Thanks!
